

802AIN Wireless USB Adapter

Installing on Windows 7

This procedure will detail the steps involved with installing the 802AIN Wireless USB Adapter on a computer running the Windows 7 operating system.

Important! The Adapter does not install automatically on Windows 7. Initially, Windows 7 recognizes the Adapter as only a USB flash memory drive. Once the Adapter's driver has been loaded, it is recognized as an 802.11N Wireless USB Adapter.

To perform the installation:

1. Connect the Adapter to an available USB port. An AutoPlay window (shown below) appears.

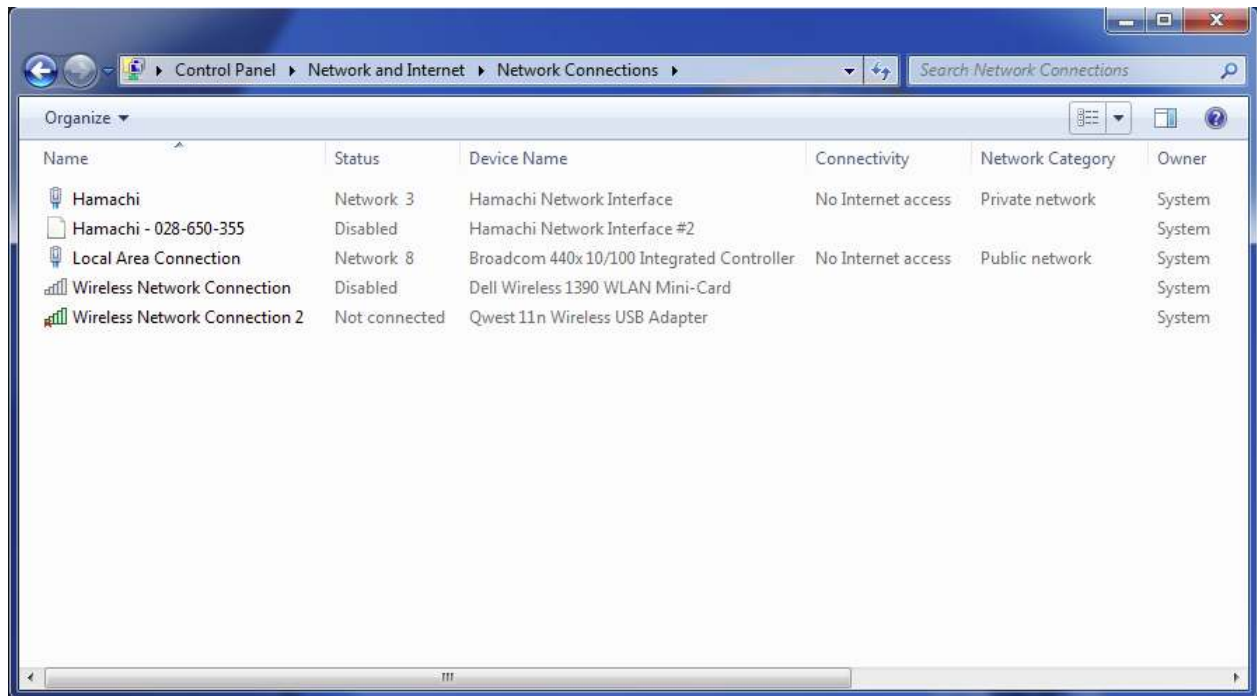

2. Select **Run Setup.exe**. The setup application begins to run.

802.11n Wireless USB Adapter

3. While the application is running, UAC (User Account Control) windows appear. Click **Yes** to run the Atheros Communications software, which installs the 11N Wireless Tools. When finished, a notification appears in the system tray.

When all installations are complete, a new Wireless Network Connection is listed in the Network Connections Control Panel screen, as shown below (Device Name: Qwest 11n USB Adapter).

Notes

- When the driver is loaded, the flash memory (recognized by the system as a USB drive) vanishes along with its assigned drive letter.
- If you inadvertently selected the “Open folder to view files” option in step 2, you can still install the drivers by double-clicking the “Setup.exe” application manually, as shown in the figure below.
